Technique	Description	Field of use																																																																																															
Screening / Sieving	Physical barrier removes large debris.	Wastewater (primary treatment), urine, feces, greywater, rainwater, organics																																																																																															
Sedimentation	Suspended solids settle by gravity.	(waste)-water																																																																																															
Decantation	Separates immiscible liquids or liquid-solid after settling (density-based).	Water/soil separation; lab industry																																																																																															
Filtration	Medium retains solids while fluid passes (residue/filterate).	Lab/Purification; air (HEPA); WT																																																																																															
Sand filtration	Granular filtration for fines.	(rain)water; WT																																																																																															
Reverse osmosis (RO)	High-pressure membrane; filtration removing solutes.	Desalination; water Purification																																																																																															
Centrifugation	Separation accelerated by rotation (density-based).	(waste)-water; Solids handling																																																																																															
Dissolved Air Flotation (DAF)	Microparticles attach to particles. So they float and are skimmed.	Industrial WW; FOA/FOB removal																																																																																															
Magnetic separation	Removes magnetic particles.	Industrial WW stream																																																																																															
Evaporation	Solvent evaporates; solute remains.	Salt recovery; W desalination; landfills leachate																																																																																															
Crystallization	Forms crystals from solution for separation/purification.	Water/chemical processing																																																																																															
Sublimation	Solid → gas to separate volatile solids.	Lab/chemical purification																																																																																															
Coagulation / Flocculation	Destabilizes particles so they clump into larger flocs.	Water and WW clarifications																																																																																															
Precipitation	Converts dissolved contaminants into solids.	Metal removal in water / WW																																																																																															
Adsorption (activated carbon)	Pollutants bind to porous carbon. Effective for organics and gases.	WT and air/VOC control																																																																																															
Absorption	Liquid absorbent absorbs / removes pollutants from gas/WW.	CO <sub>2</sub> capture; H <sub>2</sub> S removal; WW effluent																																																																																															
Wet scrubber	Common absorption device cleaning industrial exhaust with water / solution.	Air pollution control (PH + acidic gases / VOCs)																																																																																															
Ion exchange	Swaps undesirable ions on resin. Regenerable with salt/acid/base.	Water softening; heavy metals																																																																																															
Electrocoagulation (EC)	Uses electric current for coagulation. Reduces use of chemicals.	WWT																																																																																															
Liquid-Liquid extraction (LLE)	Separates by differential solubilities between two liquids. Reversible by back-extraction.	WW/groundwater; soil remediation; resource recovery																																																																																															
Bioremediation	Microbes degrade contaminants.	Soil/groundwater cleanup																																																																																															
Activated sludge process (ASP)	Microbial treatment of organics in aerated reactors.	WW/sewage treat																																																																																															
Constructed wetlands	Plant+microbe system removes pollutants.	WW/polishing; nature-based treat																																																																																															
Membrane filtration (MF UF/NFT/RO)	Size-based membrane separation. Removes salts/pathogens/particles depending on the membrane.	Water/WW; pretreatment and reuse; desalination (RO)																																																																																															
Distillation	Phase-change separation by volatility.	Purification/recovery																																																																																															
Electrodialysis	Ion-selective membranes + DC move ions between solutions.	Industrial WW																																																																																															
Supercritical fluid extraction	Uses supercritical CO <sub>2</sub> . Reversible by PT change to precipitate solute.	Industrial WW																																																																																															
Chromatography	Separation on stationary phase for complex mixtures.	Analytical/lab separation																																																																																															
Air stripping	Transform volatile compounds from water to air (off-gass treatment needed).	Groundwater/WW VOC removal; ammonia (NH <sub>3</sub> ads)																																																																																															
Membrane gas absorption	Absorption intensified using membrane contactors.	Gas treatment (CO <sub>2</sub> /odour capture)
